 FACULTAD DE CIENCIAS

BOLETIN SISMOLOGICO No 22

1 - 31 Diciembre 1977

Red Sismica de la Meseta Central

| Estación | Código | Longitud | Latitud | Elevación |
|------------------|--------|-------------|-------------|-----------|
| U. de Costa Rica | SJS | 84º 03.25 W | 9º 56.35 N | 1196 |
| La Lucha | LLS | 84º 00.10 W | 9º 44.30 N | 1400 |
| Sanatorio Durán | SDS | 83º 53.17 W | 9º 56.05 N | 2340 |
| San Ramón | SRA | 84º 26.89 W | 10º 04.95 N | 1160 |
| Volcán Poás | VPS | 84º 14.31 W | 10º 11.24 N | 2570 |

Preparado por:

Sección de Sismología, Escuela Centroamericana de Geología
 Ciudad Universitaria "Rodrigo Facio".

Apartado 35

San José, Costa Rica

Programa cooperativo con la Organización de Estados Americanos (OEA)

ihb.

15-12-77.

EXPLICACION DE LOS DATOS

- 1) EST. : Estación que registró el evento
- 2) FECHA : Todas las fechas están reportadas en tiempo medio de Greenwich (TMG)
- 3) TIEMPO: El tiempo de arribo de la fase está dado en horas, minutos y segundos en TMG
- 4) FASE: Una "i" o "e" precede al nombre de la frase para indicar el carácter del arribo.
 - a) "i" (ímpetu), indica que el primer arribo fue impulsivo y la dirección del primer movimiento es evidente.
 - b) "e" (emersio), indica un comienzo gradual en el cual la dirección del movimiento es dudoso.
- 5) COM.: Designa la componente (N, E o Z) del sismógrafo de la cual el tiempo de arribo fue medido.
- 6) DIR.: Para las fases designadas con ímpetu (iP). Una C ó D, representa un movimiento de compresión ó dilatación respectivamente.
- 7) AMP : Amplitud en mm de la fase correspondiente, medida pico a pico sobre el sismograma. Para obtener el desplazamiento del suelo es necesario corregir estos valores usando la curva de amplificación del equipo correspondiente.
- 8) PER.: Período en segundos de la fase correspondiente.
- 9) COMENTARIOS:
